

# Brake shoes

In most cases, the drum brake system is used on the car's rear wheels. This system stops the car by transferring the pressure from the brake pedal to the wheels via the brake shoes.

Over time, the friction surface of the brake shoes is gradually worn away.

Brake shoes

**New**

4-5 mm

**Needs replacing**

1 mm

If you experience any problems with your brakes, we recommend you bring your car into a Toyota dealer for an inspection.

**If you use worn out or counterfeit parts, you could find yourself in this situation...**

?! What's that scraping noise?

The back of the car's shaking!

There's smoke coming from the rear wheels!

I should have replaced the brake shoes sooner! Now the brake drums will need replacing as well...

**Can you tell which parts are genuine?**

**⚠ Beware of counterfeit parts!**

They may look the same, but they don't offer the same braking performance.

Genuine

Counterfeit

**Let us check your brake fluid too!**

The brake fluid is just as important as the brake shoes. It transfers the pressure applied to the brake pedal to the brake shoes. Brake fluid also deteriorates over time and this can affect braking performance. When the brake shoes are replaced, we recommend replacing the brake fluid as well.

**Trust your Toyota dealer for the best service.**

Have complete confidence, knowing that your car will be serviced using only Genuine Toyota Parts.
